

ABC Broadcast Operations & Engineering

47 West 66th Street, New York, NY 10023 212-456-2469

June 22, 2011

To Whom It May Concern:

This letter is to confirm that ABC Broadcast Operations & Engineering ("ABC") believes that low latency modes are a key requirement for any type of video encoding platform. Video encoding techniques are used to take advantage of limited bandwidth links and, when used for traditional TV network newsgathering or other types of production (sports, entertainment, etc.) typically involve situations with interactivity - where the receive site communicates with the transmit site. In those scenarios, if the latency is too long, the interactivity is cumbersome and is reflected on air. We typically strive to have the minimum latency possible within the limits of acceptable video quality.

I hope this illustrates our position

Sincerely yours,

Mike Strein
Director, Equipment Planning and Sustaining Engineering
