Introduction

❖ Planar mode in HM3.0

- Average of two linear interpolations without mediate stage
 - The right-column and the bottom-row are generated by replication process from the right-top pixel of above neighboring border and the left-bottom pixel of left neighboring border.
- No smoothing filter on Planar mode
 - Planar mode is mapping to DC

MDIS on Planar mode

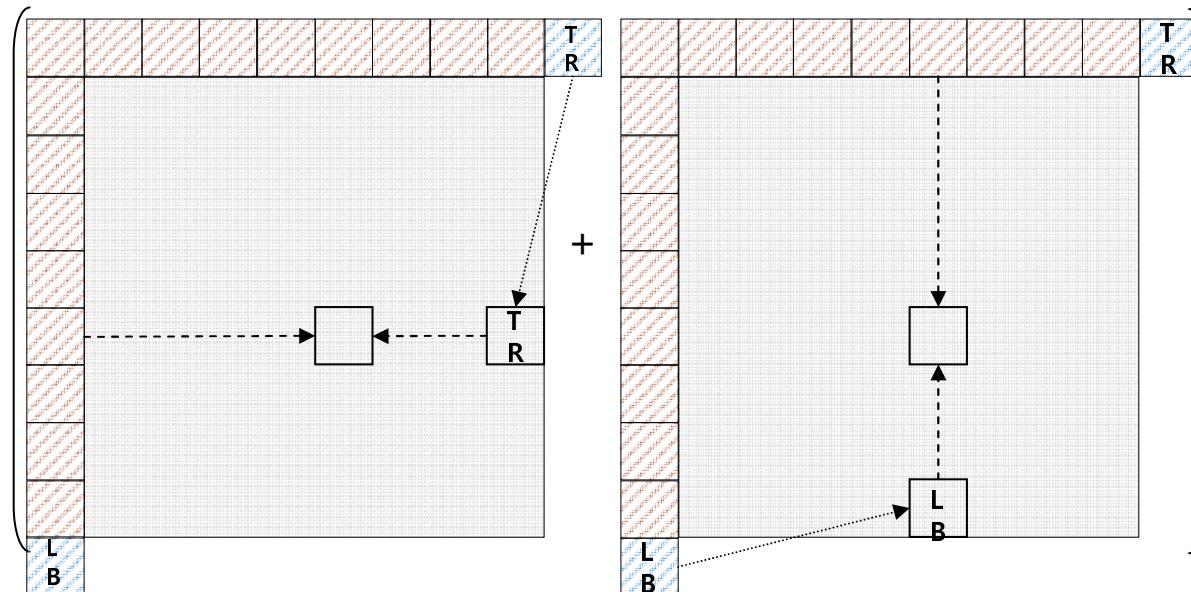

❖ Smoothing filter on Planar mode

- Filter on 16x16, 32x32 shows performance improvement
- Filter on 8x8 shows no performance change
- Filter on 4x4 shows performance loss

Shifting of top-right (T) and bottom-left (L) pixels

- ❖ To retain extrapolation feature
 - Using top-right pixel as right column
 - Using bottom-left pixel as bottom column

Experimental results

- ❖ Shifting of top-right (T) and bottom-left (L) pixels

Summary

- ❖ Modification
 - Smoothing filter on 32x32 and 16x16 planar mode
 - Using top-right and left-bottom for interpolation to retain extrapolation feature
- ❖ Coding performance
 - -0.13% HE_AI and -0.15% LC_AI
- ❖ Recommend consideration of adopting the proposed modification into next version of HM since the gain is achieved without introducing additional complexity
