Outline

- Algorithm description
- Simulation results
- Conclusions

Algorithm description

- Basic idea:
 - Reuse the ALF parameters of the prior decoded frames for current frame

- Notations
 - Filter bank generating from current picture, F1

 - Filter bank utilized in prior picture, F2

Algorithm description

- For intra frame
 - No change, the same as the current ALF
 - Update filter parameters in F2 with that in F1
- For inter frame
 - Calculate the RD cost with F1
 - If ALF enable, calculate the RD cost with F2
 - Select the best filter bank with minimum RD cost between F1 and F2

Algorithm description

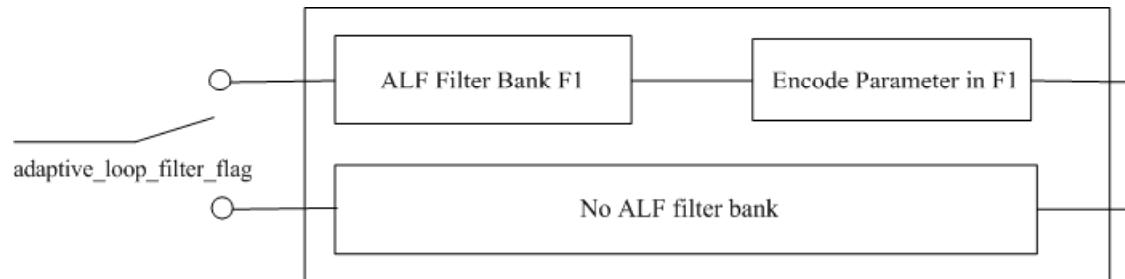

- Update parameters for F2
 - If F1 is employed for current frame, update the parameters in F2 with that in F1
 - If F2 is employed for current frame, do not update
- Filter parameters in F2
 - Block based ALF parameters
 - Region based ALF parameters

Algorithm description

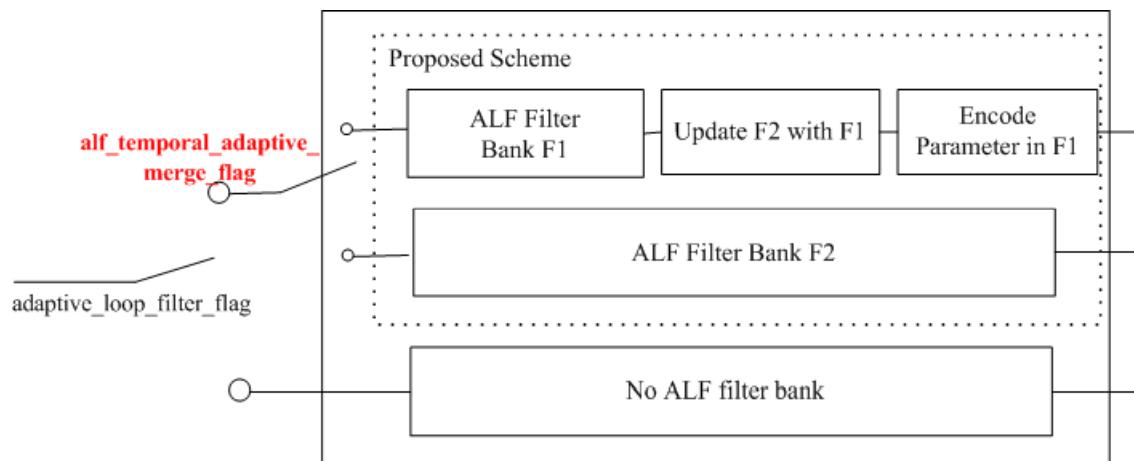

□ Filtering flowchart

■ ALF in HM 3.0

■ Proposed Scheme

Selection of F1 and F2 is based on the rate distortion cost

Simulation results

□ Compared to HM 3.0

Enc Time[%]	102%		
Dec Time[%]	102%		

Conclusions

- Adaptive loop filter merge in temporal domain

- Bit rate reduction
 - 0.3 for HE_RA, 0.2 for HE_LD, 0.2 for HE_LD_P

- Time increase
 - Encoder : 2%
 - Decoder: 2-5%

- It is recommended to add the ALF merging in temporal domain

Thanks!
