

Reduction of context bins and bypass bins grouping for cu_qp_delta

Kengo Terada

Hisao Sasai

Takahiro Nishi

Panasonic Corporation

Panasonic ideas for life

Motivation

- ✓ Reduction of context coded bins for higher throughput
- ✓ Concatenation of bypass coded bins for parallel processing

Draft7 : context coded bins is used for most of bins for cu_qp_delta

cu_qp_delta coding in Draft7

	Semantic	Binarization Type	Bin Type
<i>significant_flag</i>	$\text{Abs}(\text{cu_qp_delta}) > 0 ? 1 : 0$	FL (cMax = 1)	Context bin
<i>sign_flag</i>	$\text{cu_qp_delta} < 0 ? 1 : 0$	FL (cMax = 1)	Bypass bin
<i>absVminus1</i>	$\text{Abs}(\text{cu_qp_delta}) - 1$	TU (cMax=24+(QpBdOffsetY>>1)+sign_flag)	Context bin

Approach

- ✓ Use bypass coded bins instead of context coded bins
- ✓ Change bin coding order for concatenation of bypass coded bins

- ✓ **Swap of sign_flag and absVminus1**
- ✓ **Removal of dependency between sign_flag and absVminus1(cMax of TU)**
- ✓ **Bin coding order for sign_flag and absVminus1 is swapped**

absVminus1 binarization

Bin coding order

Draft7

Proposal STEP1

Bypass coded bins grouping

✓ Bypass coding for absVminus1

- ✓ Prefix part of absVminus1 is coded using bypass coded bins instead of context coded bins

		ctxIdxInc					Worst CtxBin Num
		binIdx=0	binIdx=1	binIdx=2	binIdx=3	binIdx>=4	
<i>absVminus1</i>	Draft7	1	2	2	2	2	25

	STEP2a	1	2	Bypass	Bypass	Bypass	2
	STEP2b	1	Bypass	Bypass	Bypass	Bypass	1
	STEP2c	Bypass	Bypass	Bypass	Bypass	Bypass	0
	J0089	1	1	1	1	Bypass	4

Prefix
(TU)

Suffix
(EG0)

STEP2c : Context coded bin is only significant_flag

All other bins are bypass coded bins (concatenation)

setting

MaxCuDQPDepth=3

AdaptiveQP=1

MaxQPAdaptationRange=12

JCTVC-J0226

Conclusion

It was confirmed that proposed modification can reduce context coded bins and isolated bypass coded bins without significant impact on coding efficiency (in range of 0.1%).

Recommendation

It is suggested to consider the inclusion of this proposal in the DIS of HEVC.
