# Palette mode JCTVC-O0218/RCE4 Test2

- On JCTVC-O0218: Palette elements are directly coded
- On RCE4 Test 2: Palette element can be predicted by the left Palette CU if it exists
- In this proposal, the palette is predicted from the last decoded palette

# Proposal

## ■ Palette predictor:

- Use the Palette of the last decoded CU palette
- Reset the palette predictor at each CTB line

## ■ Palette prediction:

- Transmit one flag for each palette element of the palette predictor
  - Selected elements are copy in the current palette
- Other palette elements are coded with the usual method

## ■ Palette size coding:

- The palette size is equal to the number of non-predicted palette elements.

# Remark on memory complexity

- Proposal: For the worst case one palette predictor of 24 elements requires:
  - $24 \times 3 = 72$  bytes
- When using the neighboring palette CU, all neighboring palettes need to be stored. So for the worst case:
  - Left predictor :  $72 \times 8$  left CU = 576 bytes
  - Up predictor, by considering a CTB line memory ~36KB for 4K content.

# Experiments results: vs JCTVC-00218

■ Anchor: Rext 5.1 + O0218

■ Test: Rext 5.1 + O0218 + Palette prediction

■ Results AI/RA/LB:

- SC:  
3.2%/1.6%/2.1%
- OSC:  
8.9%/7.1%/6.1%

■ Memory complexity:

- 72 bytes

# Conclusion

## ■ Proposal:

- Prediction of the current palette with the last used palette.

## ■ Results compared to RCE4 Test 2:

- Gains: SC: 1.2%/ 1.0%/ 0.5%
- Divide by 8 the worst case memory complexity of RCE4.2

## ■ Recommend to use this palette prediction method if the Palette Mode coding is adopted for the Range Extensions.
