# Block vector prediction method for Intra block copy

## JCTVC-Q0114

Chao Pang, Joel Sole, Rajan Joshi, Marta Karczewicz

# Introduction

- Intra block copy (Intra BC)
  - JCTVC-N0256

In current RExt,  $(-CUWidth, 0)$  is BV predictor for the first BV in a CTU, and the last decoded BV is used as BV predictor for the other BVs.

# Proposed

- To improve BV prediction:

- The left or above BV is selected as predictor, and resulting block vector difference (BVD) is encoded; If one of them is unavailable,  $(-2*PUwidth, 0)$  is used instead. If both of them are unavailable,  $(-2*PUwidth, 0)$  and  $(2*PUWidth, 0)$  are used instead;
- To avoid extra line buffer to store the above MV, only the above MV inside current CTU is allowed to be used as the predictor;
- To save extra storage, it can share the buffer used for inter MV.
